Apache Gump integration

Apache Gump builds Apache Forrest trunk each day. If dependencies (e.g. Cocoon and certain blocks) fail, then of course the build of Forrest will fail.

> **Note:**
> The main build of Forrest by Gump is disabled. If Gump would build Cocoon-2.1 branch or use built artefacts, then we could re-instate the build. Some other parts of Forrest are still built, see below.

The Gump metadata descriptor for Forrest defines a number of different projects. All ASF committers have access. Do '`svn co https://svn.apache.org/repos/asf/gump/metadata gump-metadata`'

See the Gump Object Model documentation.

Notifications are sent to the forrest-dev mailing list.

The top-level module for Forrest is at `http://vmgump.apache.org/gump/public/forrest/`

The results ...

- forrest (disabled)
- forrest-test (disabled)
- forrest-forrestbar (active)
- forrest-rat (active)
